**HTML + CSS + JAVASCRIPT**

**= 99% of front-end development**

# **CODING** **&** **DEBUGGING?**

**a special text  
editor called IDE  
&  
your BROWSER using  
the integrated  
DEVELOPER TOOLS!**

# **HyperText Markup Language** **(or just **HTML**)**

<!--HTML document comment-->

**<!doctype html>**

<!--HTML document declaration-->

**<html lang="en">**

<!--HTML starting point-->

**<head>**

<!--reserved space for description tags and  
css declaration  
-->

**</head>**

**<body>**

<!--reserved space for the page content-->

**</body>**

**</html>**

- / Open **Brackets**, create a new file, call it **index.html** and save it into your workspace
- / Inside the **index.html** write the base HTML structure
- / From the brackets **file panel** activate the **Live Preview**

/ Lets inspect closely our page content  
using the **GOOGLE CHROME  
DEVELOPER TOOL**

/ Now somewhere in the page on the **browser right  
click** → **ELEMENT INSPECTION**

**<body>**

<!--reserved space for our page content-->

**<div>**

<!--div tag used for markup grouping-->

**<p>**

<!--p o paragraph tag usually takes in a sentence-->

**BIG DIVE LESSON**

**</p>**

**</div>**

**</body>**

# DOM

- / Write inside the **body** of **index.html** a **div**. Inside the div write a **p**
- / Write inside the **p** a sentence like **eg. "BIG DIVE LESSON"**
- / Eventually reload the browser **and inspect the elements**

# **Cascading Style Sheets** **(or just **CSS**)**

```
<!doctype html>
<html lang="en">
  <head>
    <!--style here as raw rules or linked files-->
  </head>
  <body>
    <div <!-- or style here as raw rules--> >
      <p <!--or style here as raw rules--> >
        BIG DIVE LESSON
      </p>
    </div>
  </body>
</html>
```

```
<head>
  <style>
    body {
      background-color: powderblue;
    }
    <!-- css selector (element, class...) -->
    p {
      <!-- css property : css attribute -->
      color: red;
    }
  </style>
</head>
```

For **DOM** elements selection we can use  
**element selectors**, **classes** and **ids**

/ Like the previous sample  
using **element selectors** give to the **div** inside the  
**index.html** header a  
**background-color : powderblue** rule

/ Like the previous sample  
using **element selectors** give to the **p** inside the  
**index.html** header a **color : red** rule

```
<head>
  <style>
    body {
      background-color: powderblue;
    }
    p {
      color: red;
    }
    .p-with-class { color: green }
    #p-with-id { color: violet }
  </style>
</head>
```

For **DOM** elements selection we can use  
**element selectors**, **classes** and **ids**

/ Like the previous sample  
using **class selectors** give to the **p** inside the  
**index.html** header a  
**color : green** rule

/ Like the previous sample  
using **id selectors** give to the **p** inside the  
**index.html** header a **color : violet** rule

...

**<div>**

**<p id="p-with-id" class="p-with-class">**

**BIG DIVE LESSON**

**</p>**

**</div>**

**</body>**

**ID Selectors** win **over** **CLASS**  
**Selectors** that win over **ELEMENT**  
**Selectors**

**ID Selectors** VS **ID Selectors** ?

or

**CLASS Selectors** VS **CLASS Selectors** ?

**IDs should be UNIQUE**

or

**CLASS Selectors** win on **CLASS Selectors**  
**depending on the WRITING ORDER**

**and what about  
JAVASCRIPT?**

// JS line comment  
/\*JS block comment\*/

**JAVASCRIPT**  
**makes your front-end FLY**

...

**<div>**

**<p id="p-with-id" class="p-with-class">**

**BIG DIVE LESSON**

**</p>**

**</div>**

**<!--typically scripts are placed here-->**

**<script>**

// command for printing sentence

// or vars in the browser console

**console.log("My first script ever");**

**</script>**

**</body>**

- / Write inside the **body** of **index.html** a **script** that prints some sentence
- / Eventually reload the browser, **inspect the elements** and move to the **console tab** of the **BROWSER DEVELOPER TOOL**

With **JAVASCRIPT** we can  
even select **DOM** elements

eg. byID

**document.getElementById("p-with-id")**

```
<script>
```

```
  console.log("My first script ever");
```

```
  console.log(
```

```
    document.getElementById("p-with-id");
```

```
</script>
```

The **DEVELOPER TOOL CONSOLE**  
will print you out the  
**DOM** element taken by its  
**ID ATTRIBUTE**

```
<p id="p-with-id" class="p-with-class">  
    BIGDIVE LESSON </p>
```

With **JAVASCRIPT** we can  
even execute some **LOGIC** defining  
**VARIABLES** and **OPERATIONS**

**<script>**

**console.log("My first script ever");**

**console.log(**

**document.getElementById("p-with-id"));**

**var x = 5;**

**var y = 5;**

**var area = 5\*5;**

**console.log("The area is: " + area);**

**</script>**

The **DEVELOPER TOOL CONSOLE**  
will print you out the  
**OPERATION** we wrote

...

**The area is: 25**

With **JAVASCRIPT** we can  
even execute some **LOGIC** firing  
**FUNCTIONS**

**<script>**

...

// function declaration

**function calcArea(param1, param2) {  
 return param1\*param2;**

**}**

// function usage

**console.log("The area calculated using a  
func is: " + calcArea(x, y))**

**</script>**

The **DEVELOPER TOOL CONSOLE**  
will print you out the  
**OPERATION** fired from the  
**FUNCTION**

...

**The area is: 25**

**The area calculated using a func is: 25**

With **JAVASCRIPT** we can  
also **TRIGGER SOME EVENTS** and  
**RUN SOME LOGIC**

```
<div>
  <p .... onclick="printMessage()">
    BIG DIVE LESSON
  </p>
</div>
<script>
  ...
  function printMessage() {
    console.log("In the clicked DIV there
is: " + document.getElementById(
  "p-with-id").innerHTML);}
</script>
</body>
```

Now **CLICK ON THE <P>**  
**and the CONSOLE**  
will print you out the  
**CONTENT OF THE <P>**

...

”In the clicked DIV there is: “  
**BIG DIVE LESSON**

**PRACTICE IS THE WAY**

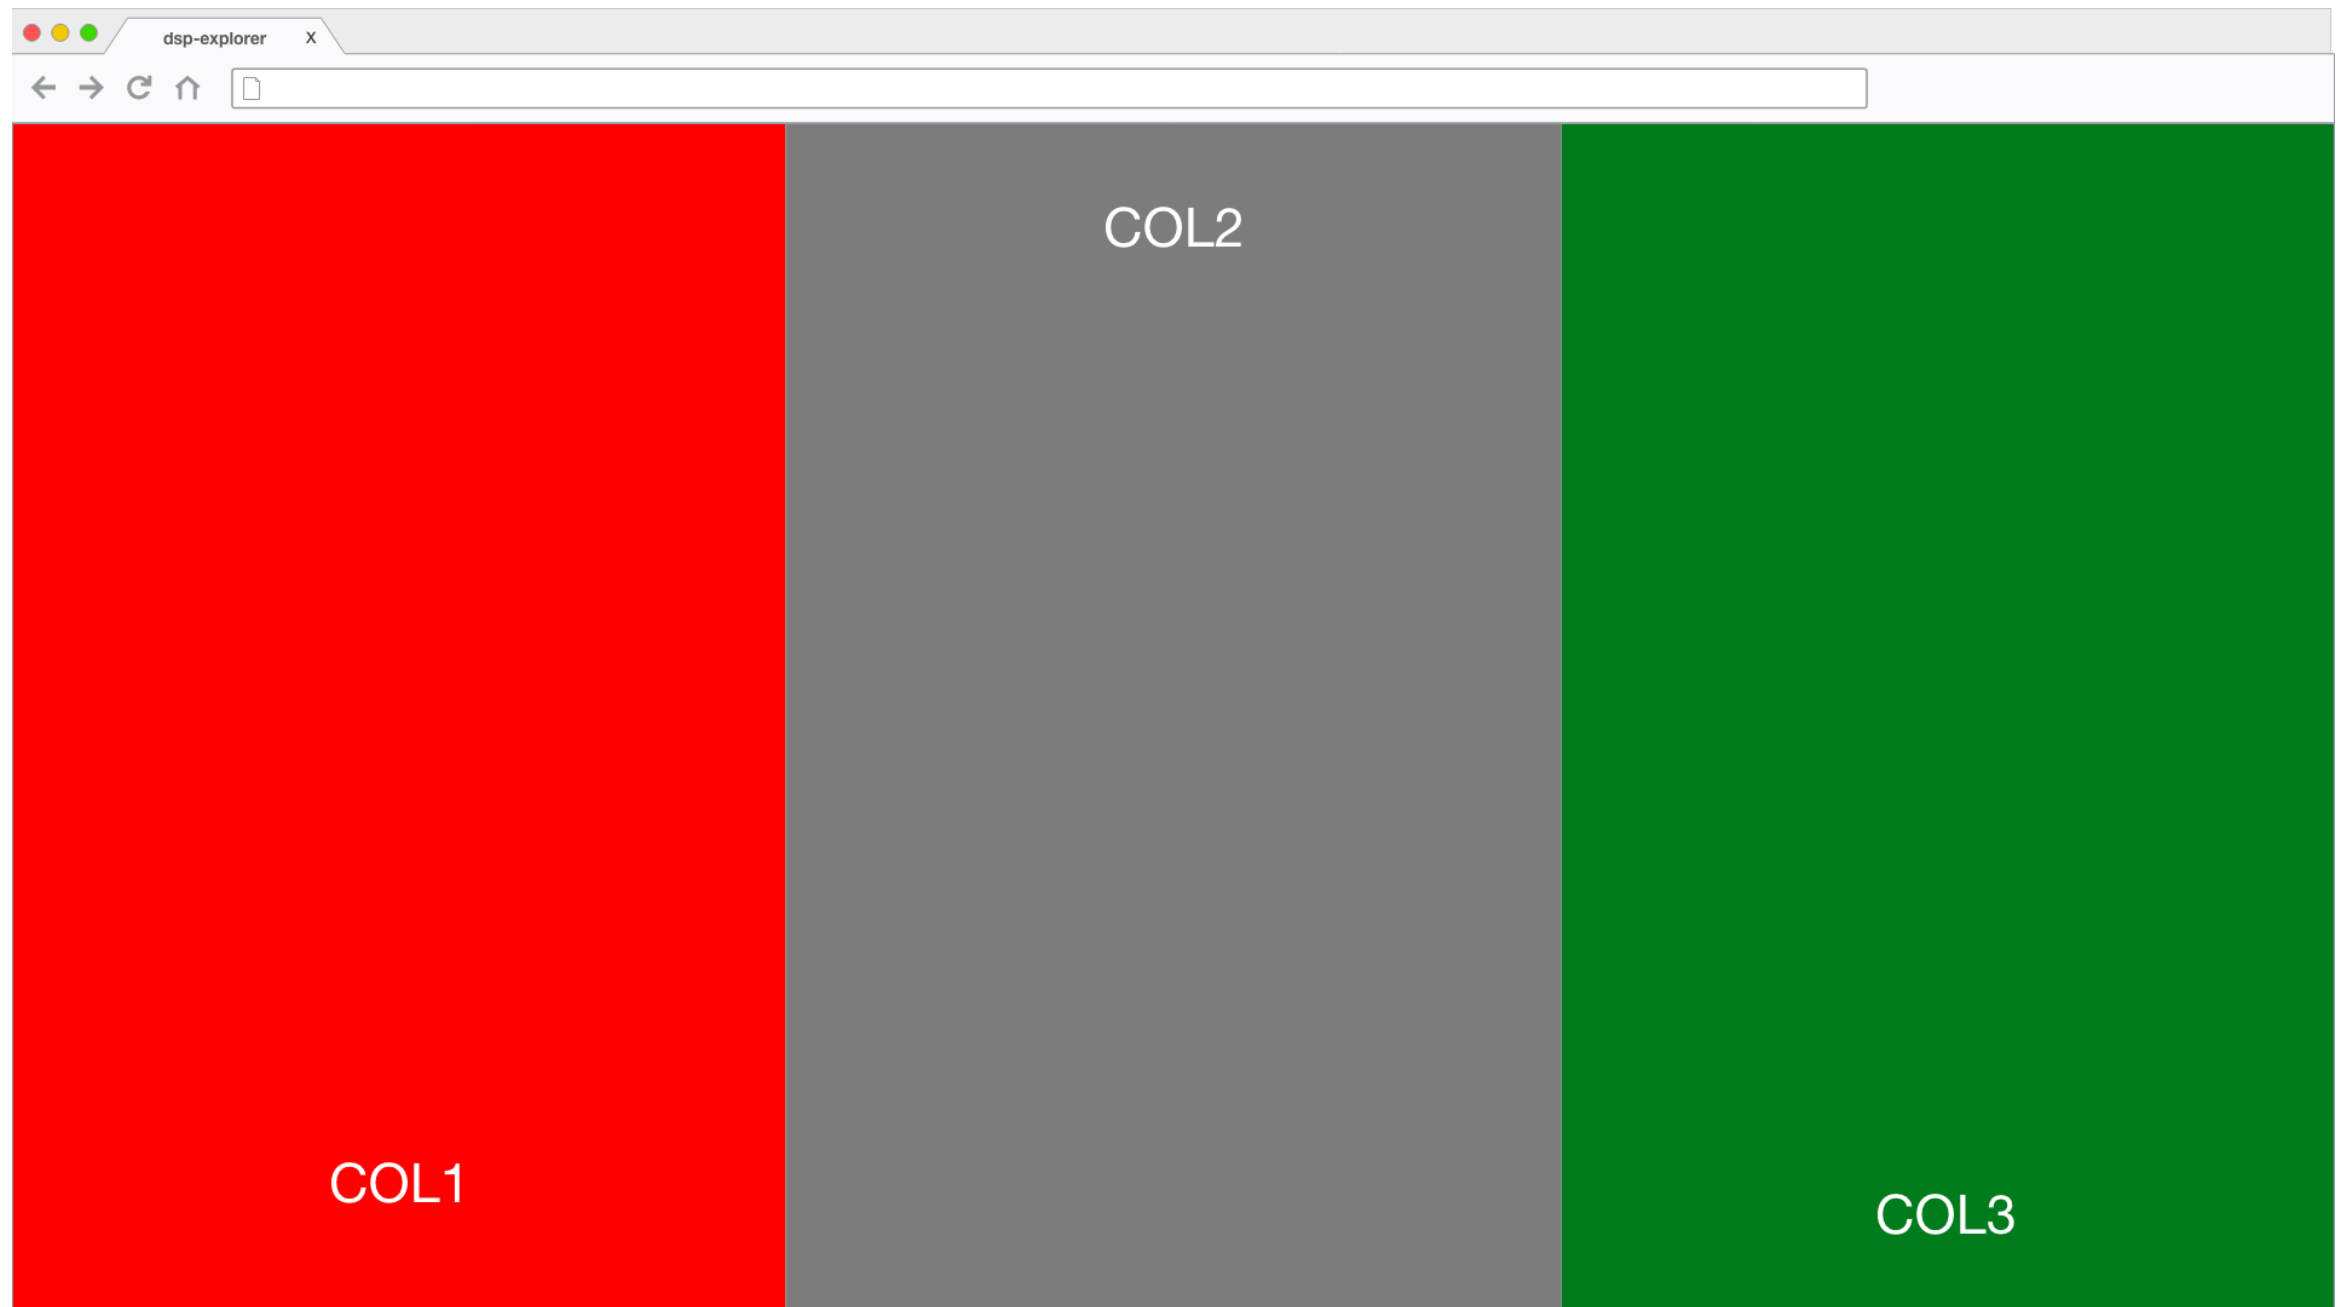

Create this simple design  
using some **HTML** and **CSS**

On **DIV HOVER**  
use javascript to change columns  
colors between them

On **DIV HOVER**  
use javascript to change columns  
colors between them
